

Does your practice have an arrangement with a nearby pharmacy/pharmacist that helps you "refer" your patients for immunizations administered at the pharmacy? If yes, how well does it work to vaccinate children and/or adults? If no, do you think your practice or your patients would benefit from establishing such partnership to increase vaccine uptake?

1. No
2. Yes. XYZ pharmacy. Though mainly Zostavax as it is not stocked in our clinic and is billed through patients' prescription insurance.
3. Works for both children and adults.
4. N/A
5. Sounds like a good idea to me, and we are interested in any practical means necessary to increase vaccination rates.
6. I use several pharmacies in town to give immunizations that I cannot afford to keep in the office.
7. Most children in my practice are VFC, so used rarely for this.
8. Zoster Vaccine is the most common that adult patients are referred/given script for...this works fairly well, although I rarely get documentation back for the medical record.
9. Health department supplies more exotic international travel immunizations - works fair and no documentation ever received for medical record.
10. And then pharmacies are ALWAYS pushing pneumonia and flu vaccine...NO documentation ever received for this and are giving immunizations not indicated (new pneumonia for instance).
11. No
12. N/A
13. Yes
